IT without Limits™

Technology has pushed boundaries so far that today's technology knows no limits. The 24x7 internet means there are no time limitations and cloud means there are no space limitations.

Today's IT architectures need to match the limitless demands of the ever-connected world with the limitless possibilities of IT built on three pillars: **on premise, hybrid cloud, and multi-cloud** infrastructure. The limitless possibilities need to be shaped by an understanding of both the technologies and the business. Whether using one, two, or all three pillars of IT, you need one strategy that's supported and guided by a single vision.

The Three Pillars of IT

The three pillars of information technology rest on a single foundation: VAST service. We focus on creating scalable, supportable IT infrastructure, wherever the devices and services reside, and go beyond issues of physical infrastructure and capacity to shore up the plans with data protection, information governance, disaster recovery and more.

VAST View™ Cloud Management

Managing systems effectively is only possible when you have visibility across all three pillars. It's difficult to get good visibility when your infrastructure is in the cloud, especially when it's distributed across multiple public clouds, hybrid clouds, and private clouds.

Overcome those challenges and get a clear view of your total system status with VAST View™. Our cloud management platform provides complete visibility across all your clouds, allowing you to monitor and manage cost, utilization, performance, configuration, and security from a single console.

Platform Management

See the status of your cloud at a glance. Implement configuration management and capacity management to make sure your resources are being used wisely.

Cost Optimization

Know where you're spending, eliminate idle instances, consolidate low-use instances, and make smart decisions about when to use reserved instances.

Security

Keep cloud data under your control. Monitor for risks, implement policies effectively, and use a cloud access security broker to enhance data security.

Compliance and governance

Apply data governance tools in the cloud. Enforce policies to ensure data is managed appropriately.

Managed cloud services

Handle the day-to-day support needs on Amazon Web Services (AWS), Microsoft Azure, and Google Cloud Platform (GCP).
